

HOME CARE INSTRUCTIONS FOR DENTISTRY/ORAL SURGERY PATIENTS WITH TEETH EXTRACTIONS

Your pet's **teeth** have been **cleaned** with an ultrasonic scaler, **polished** dental prophy paste, and had a fluoride treatment applied today while under anesthesia. We have also extracted some of your pet's teeth today. Your pet's **ears were cleaned and nails were cut** today at no charge. Please read the following recommendations to ensure a smooth recovery:

1. Your pet **may be groggy** due to the anesthesia and pain killers. Please use a leash, carry your pet or use a carrier to protect your pet when leaving the hospital.
2. When your pet arrives home, keep him/her quiet for a few hours. **Offer water and feed a small amount** at first to avoid vomiting. As the night goes on you may gradually offer more food. The next morning you may return to your pet's normal feeding schedule. Feed your pet a **canned or soft diet for ~7-14 days**. If your pet normally eats hard food only, please soak his/her food in water for 15 minutes before feeding. This process allows your pet's gums to heal.
3. You may observe **decreased activity or appetite for 1-2 days**. However, please call us if your pet exhibits any of the following symptoms: refusal to drink water for longer than 1 day, loss of appetite for more than 2 days or excessive weakness, depression, vomiting or diarrhea. Some patients may not have a bowel movement for 1-3 days. Your pet **may have a mild cough** for a few days due to a breathing tube placed in the trachea.
4. Do not allow access to chew toys for 2 weeks.
5. Your pet may experience minor bleeding or swelling from the gums. This is normal. Should bleeding or swelling appear excessive, please call us.
6. Please do not disturb the extraction site(s) as this may lead to bleeding. The extraction site(s) may be sutured closed, if this is the case, the **sutures will dissolve in a few weeks**.
7. **Antibiotics** are often prescribed if there is a possibility of infection; please finish all of the prescription as directed to treat and prevent infection. **Pain killers/anti-inflammatories** may also be prescribed for a few days.
8. **Restrict your pet's activity for the next 7-14 days**. Do not allow any strenuous activity (running, jumping, rough playing with other pets or children, etc...). Your pet should be confined indoors if possible and dogs should be leash walked only for a few days in order to restrict their activity and to monitor their bowel movements.

(over)

9. Your veterinarian may want to re-examine your pet's teeth in about 1-2 weeks to ensure normal healing has taken place.
10. Brushing your pet's teeth is the best way to keep your pet's teeth clean. It requires some commitment and time, but it will pay off in the reduction of plaque and tartar formation.
11. For instructions on teeth brushing and oral hygiene, please see sheet on "How to Brush Your Pet's Teeth".
12. Other ways to help clean your pet's teeth include special diets that scrape off plaque from the teeth, water additives, oral rinses, dental wipes and rawhide treats impregnated with antimicrobials and enzymes also help reduce plaque and tartar. Ask your veterinarian about these products.
13. Your pet's teeth may need to be professionally cleaned as often as every 6-12 months. Some dogs, especially small breeds, are prone to excessive plaque and tartar buildup in less than 1 month! Please bring your pet to see his/her veterinarian for regular dental check-ups.

Please call (305) 238-5161 if you have any questions or concerns.
